Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

## ABSTRACT

This document discusses the procedure for using the FASP, Facility for Automated Software Production, located at the Naval Air Development Center in Warminster, Pennsylvania. A datalink from the VAX in building 80 to NADC exists and may be accessed to assemble SPL code which is used within the UYS-1, a signal processor utilized by each sonar system. The procedure for processing the SPL code via the FASP, transforming it into a form usable within the UYS-1 and executing the code is explained.

## ADMINISTRATIVE INFORMATION

This memorandum was prepared by Barbara Bower Welles under Project No. B67800, AN/SQR-19, Principal Investigator C. Nawrocki, Code 33B3.

The author of this memorandum is located at the New London Laboratory, Naval Underwater Systems Center, New London, Connecticut 06320.

## ACKNOWLEDGEMENT

J. Vernaglia of Code 33B is responsible for providing me with the necessary documents and information which enabled me to investigate the uses of the FASP and the UYS-1.

## I. INTRODUCTION

In order to use the FASP, Facility for Automated Software Production, a password and username must be obtained. Contact Charlie Cerquitella, 215-441-2486, at NADC to establish an account. The command @DBA2:[PROTEUS.19]LOGIN.COM should be placed in your login command file if the SQR-19 UYS-1 is to be accessed. Use the sonar system number that applies to you.

Note the page of references at the end of this memorandum for documents which are necessary in using the FASP and the UYS-1, for programming with SPL, and for understanding what I am about to discuss.

## II. FASP PROCEDURE

Store your SPL program (example: Figure 1) and FASP job stream (example: Figure 2) in the VAX. In order to assemble, link, use the relocating loader, and encode the SPL program, the following procedure should be followed:

Access MUX. MUX enables you to use the remote job entry channel to NADC. Only one user at a time may use the datalink. In the command mode input

MUX

The system will prompt you for a site address. The proper response is

160

An input file and an output file must be opened. The input file contains your SPL program and the output file will contain whatever is returned from NADC after assembly. The commands are

I filename.type  
O filename2.type

To contact NADC through the remote job entry channel use the command

REM

The datalink telephone, located behind the VAX in building 80, must now be dialed. Dial out with the TALK button pressed down, wait for a tone, press the red DATA button and hang up the receiver. The number is 93-1-215-674-9850. You will be prompted for your username and password.

To send the SPL program down to NADC use the command

GO,CR1

See Figure 3 for a list of commands which may be used on the remote job entry channel.

A short period of time will elapse and a "Ready" response will appear. To determine whether your program is ready to be returned, query the print queue by using the command

DIS,PR

Depending upon the complexity of your SPL program, the program name may not appear in the queue until hours later. The program name that appears will not be the filename you designated but a code assigned at NADC.

When your program appears in the print queue, retrieve it by using the command

```
GO,LP1
```

A "Ready" response indicates that the output file you designated contains your assembled program.

The command which will return you to MUX is

```
CTRL/Z
```

While in MUX, close the input and output files and "log keep" so you do not need to redial NADC. The appropriate commands are

```
CL O
CL I
L KEEP
```

Examine your output file to insure that there are no errors. If there are, correct your file using the VAX editor, change the identification number of your program by updating the version character and date, if necessary, change ADD to REP, and begin the procedure once again. (See Figure 1).

When your program is free of errors, send the FASP job stream to NADC to generate a load module, access the relocating loader and linker, include your program in the database, and encode your program. Access the remote job entry channel as previously described and open an output file and an input file, the FASP job stream. (See Figure 2). By following the procedure explained above, the hex code of the SPL program will be returned in the output file. To exit the remote mode type a CTRL/Z and to log out of MUX type LOG. You must log out of MUX before logging off the terminal because you will remain connected to MUX if you do not.

### III. VAX PROCEDURE

Hex code may be patched using the normal editing procedures on the VAX. (Note: Error messages were being produced for the use of apostrophes within the SPL code so patching was necessary.)

The hex code must be converted to binary code for the UYS-1. Using "binfile" as the name of the file to contain the binary code and "hexfile" as the name of the file containing the hex code, use the command

```
LTS binfile.type=hexfile.type
```

to achieve the hex to binary conversion.

An initial microprogram load on the UYS-1 must occur each time you wish to run a program. The command is

```
IPL
```

This sends an initializing program to the UYS-1, via the Proteus Digital Channel, which is converted to microcode and establishes the unit loader, a program on the UYS-1 that deciphers which channels are being used, and the file identification number is determined. This communication is one way from the VAX to the UYS-1. The system will respond with

```
TST
SRL
X
TST
CIW F0050000
#E0000060
#E0000020
X
$
```

if the IPL is successful. If the UYS-1's power is not on, the response will stop at CIW F0050000.

The system I/O must be invoked with the specification of a disk file which is built in with the utility task LTS. To activate the binary file in the VAX which communicates with the unit loader in the UYS-1 and establish two way communication use the command

SIO binfile.type

The system will respond with

```
SIO ADAPTER EMULATION PROGRAM
TYPE CTRL C FOR ATTENTION
```

After typing a CTRL/C, the system will respond with a question mark. A control interrupt word is being requested. Input

```
CIW 01040001
CTRL/C
```

The system will respond with another question mark, requesting the data word

```
DW 00056000
```

to indicate UYS-1 source channel 5 and file group 6 are being accessed. The system will respond with

```
#01800000
CHANNEL RESET
#01000000
```

To exit SIO input

```
CTRL/C
X
```

TM No. 851005

Your applications program stored in the VAX (example: Figure 4) which interacts with the SPL program loaded into the UYS-1 may now be executed.

To debug the SPL program, use the Test Bed Command Language in order to examine the contents of storage locations within the UYS-1. Refer to the user's manual for more information.

## APPENDIX A

Appendix A contains all the possible VAX/VMS System I/O function codes and modifiers to these codes for VAX/UYS-1 interaction via the Proteus Digital Channel. Note reference 9 and Figure 4 for information on using these.

## APPENDAGES TO THE VAX/VMS FUNCTION CODES

Modifiers (prefix to function code) for Proteus Digital Channel  
Output Driver (VAX to UYS-1)

- 0 - CIW
- 1 - NIW
- 2 - CW
- 3 - DW

Modifiers for Proteus Digital Channel Input Driver (UYS-1 to VAX)

- 0 - CIW,NIW,CRS,SRL
- 1 - CIW,NIW,DW,CRS,SRL
- 2 - CIW,NIW,CW,CRS,SRL
- 3 - ALL SEQUENCES
- 4 - CRS,SRL

## APPENDIX B

Appendix B contains all the possible status codes which may be returned when a VAX/VMS System I/O function occurs.
